

PROJECT DESCRIPTION

1) Movie recommendation system with the help of user ratings and movie genre

The Movie Recommendation System utilizes a sophisticated algorithm to provide personalized film suggestions to users. It incorporates two main factors: user ratings and genre preferences. By analyzing a user's past movie ratings, the system identifies patterns and similarities between their preferences and those of other users.

This collaborative filtering approach helps generate recommendations that align with the user's taste.

2) Stock prediction for n duration

The Stock Prediction is an advanced stock prediction system designed to forecast the performance of stocks over a specific duration. Using machine learning algorithms and historical stock data, the system analyzes patterns, trends, and market indicators to generate accurate predictions.

3) Music recommendation system based on the emotion

The Recommendation is an innovative music recommendation system that tailors music suggestions based on user emotions. Using advanced sentiment analysis and music classification algorithms, the system deciphers the user's current emotional state and matches it with a curated playlist.

4) Automatic attendance system with the help of open CV and machine learning

The Auto Attendance System, powered by Open CV, revolutionizes attendance management. This automated solution utilizes machine learning technology to accurately identify and record students or participants as they enter a space. By analyzing facial features, the system swiftly matches individuals with pre-registered profiles, marking attendance instantly and effortlessly.

5) Ipl score prediction

The IPL Score Prediction using the machine learning Algorithm is a sophisticated model designed to forecast scores in IPL matches. Leveraging the algorithm, the system considers historical match data, player performance, team dynamics, and other relevant factors to make accurate predictions. This amalgamation of data science and cricket expertise delivers a powerful tool for anticipating IPL match scores with enhanced precision and contributing to a deeper understanding of the game's dynamics.

6) Climate based health analytic on human and bird

The Climate-Based Health Analytic for Humans and Birds is a comprehensive study that investigates the correlation between climatic conditions and the well-being of both humans and avian species. By analyzing environmental variables such as temperature, humidity, and air quality, the study aims to uncover potential health implications. Through rigorous data analysis, it seeks to identify patterns and trends in human health issues, as well as changes in bird migration patterns, nesting behaviors, and overall population health.

7) Fuel consumption prediction

The Fuel Consumption Prediction study employs advanced data analysis techniques to forecast fuel consumption accurately. By leveraging historical consumption data, vehicle characteristics, driving patterns, and environmental variables, the model predicts future fuel usage with high precision.
